                                                                                                                                                                                                                                                                                                                                                                                                The entire 2S-albumin storage protein precursor including signal peptide. It is to be inserted into plants under the a seed-specific promoter and expressed at high levels only in the seed forming stage and produced mostly in the seeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 1989-150783/20.

                                                                                         This peptide is encoded by the plasmid pIG8. pIG8 was cloned using the primer sequences given in AAQ38726-27, and represents the radish 28 albumin cDNA. The sequence of primer OWB20 was based on the published sequence of the radish 28 albumin pBA3 cDNA. Primer OWB18 was based on the sequence of the oilseed rape napin pNAP1 cDNA. Using these primers introduces a BamHI recogition site at the 5' end and an XbaI cC site at the 3' end. Total cDNA isolated from Raphanus sativus plants was used as a template for the amplification reaction. The PCR-product was used as a template for the amplification reaction. The PCR-product was cut with BamHI and XbaI, subcloned into pEMBLI8+ pre-digested with the same enzymes and sequenced. The resulting plasmid was designated pIG8. This albumin type protein exhibits antifungal and antibacterial activity and can be used to eradicate a pathogen already established con a plant or to protect a plant from future pathogenic attack. Plants can be transformed using pIG8 to provide improved resistance to pathogens. This albumin-type protein showed synergistic activity with this pathogens. This albumin-type protein showed synergistic activity with

                                   DNA sequences capable of being assembled in a complementary over-
lapping relationship to provide the complete DNA. The protein is
translated as the straight chain shown and undergoes post translational
modification to give the mature protein which has two subunits joined by
Sequence
                                                                                                                                             Improving the content of an amino acid in a
to enhance nutritional value - by replacing
with DNA encoding the amino acid
                                                                                                                                                                                            WPI; 1994-167470/20.

                                                                                                                                                                              Stabilisation of a non-peroxisomal protein or peptide that is unstable in, or toxic for, a yeast and made by expressing a heterologous DNA sequence in the yeast, comprises expressing it with a sequence that targets to peroxisomes to stabilise/detoxify in the yeast peroxisomes. The method is especially used when the the non-peroxisomal protein is the 2s storage protein (this sequence) of Brazil nuts or the synthetic peptides E (See AAB62763) and ELE (See AAR62764). Yeast expressing these proteins are useful as food additives (having a high content of essential amino acids).
                                                                                                                                                                                                                                                                                                                                                                                   Improving stability of protein or peptide in yeast - by expressing with a peroxisomal targetting sequence, allowing accumulation of unstable or toxic products, and new yeast strains
                                                                                                                                                       Sequence

   aaw10569; Mabinlin II prepromabinlin.
   (from "consensus_ags.pep")
   TOIG of: aaw10569    check: 5768    from:
 The present sequence represents the mabinlin (MBL) II prepromabinlin preproprotein from the seeds of the Capparis masakai plant. Mabinlin is limited by its native availability and so methods for producing recombinant mabinlin protein are being produced using chimeric genes such as MBLII (see AAT60776). The products provide recombinant materials for the production of the MBL protein in practical amounts, and for the production of transgenic plants containing inherently sweet edible parts by virtue of production of MBL in situ. The MBL protein can be used to sweeten foods, beverages, animal feeds, chewing gum, dental hygiene products and pharmaceuticals.

    aw23586; Mabinlin MBLI from Capparis masaikai.
    (from "consensus_ags_pep")
    TOIG of: aaw23586 check: 7526 from: 1 to: 15
The present sequence represents the mabinlin MBLI. The encoding cDNA can modulate the expression of the gene encoding MBL in a cell or tissue. Mabinlin comes from the seeds of the Capparis masaikai plant, and is limited by its native availability, and so methods for producing recombinant mabinlin protein are being produced using chimeric genes such as MBLII (see AAT60776). The products provide recombinant materials for the production of the MBL protein in practical amounts, and for the
                                                                                                                                                                                                                                                                                              09-JAN-1997

The encoding cDNA can modulate the expression of the gene encoding MBL in a cell or tissue. Mabinlin comes from the seeds of the Capparis masaikai plant, and is limited by its native availability, and so methods for producing recombinant mabinlin protein are being produced using chimeric genes such as MBLII (see AAT60776). The products provide recombinant materials for the production of the MBL protein in practical amounts, and for the production of transgenic plants containing inherently sweet edible parts by virtue of production of MBL in situ. The MBL protein can be used to sweeten foods, beverages, animal feeds, chewing gum, dental hygiene products and pharmaceuticals.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        production of transgenic plants containing inherently sweet edible parts by virtue of production of MBL in situ. The MBL protein can be used to sweeten foods, beverages, animal feeds, chewing gum, dental hygiene products and pharmaceuticals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents the mabinlin MBLIII. The encoding cDNA can modulate the expression of the gene encoding MBL in a cell or tissue. Mabinlin comes from the seeds of the Capparis masaikal plant, and is limited by its native availability, and so methods for producing recombinant mabinlin protein are being produced using chimeric genes such as MBLII (see AAT60776). The products provide recombinant materials for the production of the MBL protein in practical amounts, and for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mabinlin nucleotide sequences - for prodn. crecombinant proteins, useful as sweeteners,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This represents a wild-type Brazil Nut 2s albumin seed storage protein. The invention relates to modified Brazil Nut 2s albumin proteins that are rich in essential amino acids and nucleic acids encoding the modified proteins. The modified Brazil nut 2s albumin are selected from a group comprising of BNCNSS, BN11, BN15, BN17, BN18, BN19, BN153KW, AT2SIBN15, AT2SIBN19, AT2SIBN153KW genes. Chimeric genes comprising a nucleic acid fragment encoding a modified Brazil nut 2s protein operably linked to suitable regulatory sequences, integrated into the genome of a transformed plant can be can be used in methods for increasing the essential amino acid content of seeds. The products can be used to provide a human and animal dietary protein in seed crop plants that is relatively high in essential amino acid content.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to modified Brazil Nut 2S albumin seed storage proteins and nucleic acids encoding the modified proteins. The modified Brazil nut 2S albumin proteins are rich in essential amino acids and the encoding genes selected from a group comprising of BNCNSS, BN11, BN15, BN17, BN18, BN19, BN153KW, AT2SIBN15, AT2SIBN19, AT2SIBN153W genes. Chimeric genes comprising a nucleic acid fragment encoding a modified Brazil nut 2S protein operably linked to suitable regulatory sequences, integrated into the genome of a transformed plant can be can be used in methods for increasing the essential amino acid content of seeds. The methods for increasing the essential amino acid content of seeds. The
                                                                                                                                                                                                                                                                                                                                                                                                                                      products can be used to provide a human and animal dietary protein in seed crop plants that is relatively high in essential amino acid content. The present sequence represents the amino acid sequence of a modified Brazil Nut 2S albumin gene BNCNSS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New modified Brazil Nut 2S albumin proteins - useful to provide transgenic seed crops whose proteins have increased levels of essential amino acids

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     encoding genes selected from a group comprising of BNCNSS, BN11, BN15, BN17, BN18, BN19, BN155KW, AT2SIBN15, AT2SIBN19, AT2SIBN19, AT2SIBN153W genes. Chimeric genes comprising a nucleic acid fragment encoding a modified Brazil nut 2S protein operably linked to suitable regulatory sequences, integrated into the genome of a transformed plant can be can be used in methods for increasing the essential amino acid content of seeds. The products can be used to provide a human and animal dietary protein in seed crop plants that is relatively high in essential amino acid content. The present sequence represents the amino acid sequence of a modified Brazil Nut 2S albumin gene BN15. The modified BN15 has contains 11 Arg residues of the wild-type protein replaced with Lys residues.

The modified Brazil nut 2s albumin proteins are rich in essential amino acids and the encoding genes selected from a group comprising of BNNSS, BN11, BN15, BN17, BN18, BN19, BN153KW, AT2S1BN15, AT2S1BN19, AT2S1BN153W genes.

Chimeric genes comprising a nucleic acid fragment encoding a modified Brazil nut 2s protein operably linked to suitable regulatory sequences, integrated into the genome of a transformed plant can be can be used in methods for increasing the essential amino acid content of seeds. The products can be used to provide a human and animal dietary protein in seed crop plants that is relatively high in essential amino acid content. The present sequence represents the amino acid sequence of a modified Brazil Nut 2s albumin gene BN15. The modified BN15 has contains 15 Arg cresidues of the wild-type protein replaced with Lys residues.
                                                                                                                                                                                                                                                                          TOIG of: aaw86268

The products can be used to provide a human and animal dietary protein in seed crop plants that is relatively high in essential amino acid content. The present sequence represents the amino acid sequence of a modified Brazil Nut 28 albumin gene BN17. The modified BN17 has all the 15 Arg residues, Gly at position 105 and Ser at position 107 of the wild-type protein replaced with Lys residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New modified Brazil Nut 2S albumin proteins - useful to provide transgenic seed crops whose proteins have increased levels of essential amino acids

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to modified Brazil Nut 2S albumin seed storage CC proteins and nucleic acids encoding the modified proteins. The modified CC Brazil nut 2S albumin proteins are rich in essential amino acids and the CC encoding genes selected from a group comprising of BNCNSS, BN11, BN15, CC BN17, BN18, BN19, BN153KW, AT2SIBN15, AT2SIBN19, AT2SIBN15W genes. CC Chimeric genes comprising a nucleic acid fragment encoding a modified CC Brazil nut 2S protein operably linked to suitable regulatory sequences, CC integrated into the genome of a transformed plant can be used in CC methods for increasing the essential amino acid content of seeds. The products can be used to provide a human and animal detary protein in CC seed crop plants that is relatively high in essential amino acid content. CC The present sequence represents the amino acid sequence of a modified CC Brazil Nut 2S albumin gene BN18. The modified BN18 has all the 15 Arg CC residues, Gly at position 105, and Ser at positions 44 and 107 of the cx wild-type protein replaced with Lys residues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to modified Brazil Nut 2S albumin seed storage proteins and nucleic acids encoding the modified proteins. The modified Brazil nut 2S albumin proteins are rich in essential amino acids and the encoding genes selected from a group comprising of BNCNSS, BN11, BN15, BN17, BN18, BN19, BN153KW, ATZSIBN15, ATZSIBN19, ATZSIBN153W genes. Chimeric genes comprising a nucleic acid fragment encoding a modified Brazil nut 2S protein operably linked to suitable regulatory sequences, integrated into the genome of a transformed plant can be can be used in methods for increasing the essential amino acid content of seeds. The

                                                  proteins and nucleic acids encoding the modified proteins. The modified Brazil nut 28 albumin proteins are rich in essential amino acids and the encoding genes selected from a group comprising of BNCNSS, BN11, BN15, BN17, BN18, EN19, BN153KW, AT2SIBN15, AT2SIBN19, AT2SIBN153W genes. Chimeric genes comprising a nucleic acid fragment encoding a modified Brazil nut 28 protein operably linked to suitable regulatory sequences, integrated into the genome of a transformed plant can be can be used in methods for increasing the essential amino acid content of seeds. The products can be used to provide a human and animal dietary protein in seed crop plants that is relatively high in essential amino acid content. The present sequence represents the amino acid sequence of a modified Brazil Nut 28 albumin gene BN153KW.
                                 Sequence
                                                                                                                                                                                    The invention relates to modified Brazil Nut 2S albumin seed storage
                                                                                                                                                                                                       Claim 6; Fig 8; 80pp; English.

                           The invention relates to modified Brazil Nut 2S albumin seed storage proteins and nucleic acids encoding the modified proteins. The modified Brazil nut 2S albumin proteins are rich in essential amino acids and the encoding genes selected from a group comprising of BNCNSS, BNI1, BNI5, BNI7, BNI8, BNI9, BNI53KW, AT2SIBNI5, AT2SIBNI9, AT2SIBNI53W genes. Chimeric genes comprising a nucleic acid fragment encoding a modified Brazil nut 2S protein operably linked to suitable regulatory sequences, integrated into the genome of a transformed plant can be can be used in methods for increasing the essential amino acid content of seeds. The products can be used to provide a human and animal dietary protein in seed crop plants that is relatively high in essential amino acid content. The present sequence represents the amino acid sequence of a modified Brazil Nut 2S albumin gene AT2SIBNI5.

                                  AAW86273 Length:
                                                                                                                                              Chimeric genes comprising a nucleic acid fragment encoding a modified Brazil nut 25 protein operably linked to suitable regulatory sequences, integrated into the genome of a transformed plant can be used in methods for increasing the essential amino acid content of seeds. The products can be used to provide a human and animal dietary protein in seed crop plants that is relatively high in essential amino acid content of the present sequence represents the amino acid sequence of a modified Brazil Nut 25 albumin gene AT2SIBN19.
                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to modified Brazil Nut 2S albumin seed storage proteins and nucleic acids encoding the modified proteins. The modified Brazil nut 2S albumin proteins are rich in essential amino acids and the encoding genes selected from a group comprising of BNCNSS, BNI1, BNI5, BNI9, BNI9, BNI9, BNI5, BNI9, BNI

                                                                                                                                                   Chimeric genes comprising a nucleic acid fragment encoding a modified Brazil nut 2S protein operably linked to suitable regulatory sequences, integrated into the genome of a transformed plant can be can be used in methods for increasing the essential amino acid content of seeds. The products can be used to provide a human and animal dietary protein in seed crop plants that is relatively high in essential amino acid content. The present sequence represents the amino acid sequence of a modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to modified Brazil Nut 2S albumin seed storage proteins and nucleic acids encoding the modified proteins. The modified Brazil nut 2S albumin proteins are rich in essential amino acids and the encoding genes selected from a group comprising of BNCNSS, BNII, BNI5, BNI7, BNI8, BNI9, BNI53KW, ATZSIBNI5, ATZSIBNI9, ATZSIBNI53W genes.

                              The present sequence represents the CM17 protein of wheat. The lipid CC binding domain of the CM17 gene was used to modify glutenins and seed CC storage proteins, in the method of the invention. The specification CC describes a method for producing a modified glutenin or seed storage protein, by adding to the protein a domain that confers the ability CC to incorporate into gluten, or to bind a ligand or other macromolecule. CC The domain can be any domain that will bind ligands that may be useful in food preparation or in food composition, e.g. a domain that binds CC lipids or starch. The method is used for producing modified glutenins. CC Glutenins and seed-storage protein are useful for preparing food CC products such as leavened or unleavened breads, pasta, noodles, CC breakfast cereals, snack foods, cakes, pastries and foods containing for preparing nonfood products such as films, coatings, adhesives, CC building materials and packaging materials. Grain or parts of grain containing the modified glutenin and seed-storage protein is useful for preparing food products. The modified glutenins and seed-storage protein is useful for preparing food products. The modified glutenins and seed-storage protein seeful are also useful as modifiers of food products in food industry.

This is the wheat puroindoline B protein sequence. Friabilin is a 15kD cc marker protein for grain softness, and is composed of Puroindoline A and Puroindoline B. Friabilin is present in high amounts on the surface of CC soft wheat starch, and in low amounts on hard wheat starch. The CC puroindolines have tryptophan-rich, hydrophobic domains which have affinity for binding lipids. Puroindoline A and puroindoline B are used in the production of transgenic plants with modified grain hardness. The CC invention can be used to produce plants with softer grain texture, where CC invention can be used to produce plants with softer grain texture, where CC the produced through the introduction of a nucleic acid sequence CC which operably encodes a puroindoline protein into a cell from the parent CC plants are produced sare generated for the cell containing the nucleic acid sequence. Which operably encodes a puroindoline protein into a cell from the parent CC plants, progeny plants are generated for the cell containing the nucleic acid sequence. The methods can be used for producing transgenic plants with softer textured grain from plants such as wheat, sorghum, crice, barley and maize. They can also be used for producing transgenic plants with harder textured grain from plants such as wheat, rye, conference which require less million.
                                                                                                                                                                                                                                                                                                                                                                                                                             Altering grain hardness in plants by puroindoline proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Puroindoline B; friabilin; grain

                                                       This is the wheat serine substituted puroindoline B protein sequence. Friabilin is a 15kD marker protein for grain softness, and is composed of Puroindoline A and Puroindoline B. Friabilin is present in high amounts on the surface of soft wheat starch, and in low amounts on hard wheat starch. The puroindolines have tryptophan-rich, hydrophobic domains which have affinity for binding lipids. Puroindoline A and puroindoline B are used in the production of transgenic plants with modified grain hardness. The invention can be used to produce plants with softer grain texture, where at least one parent plant has a hard texture grain. The softer grained plants are produced through the introduction of a nucleic acid sequence which operably encodes a puroindoline protein into a cell from the parent plant, progeny plants are generated for the cell containing the nucleic acid sequence. The methods can be used for producing
transgenic plants with softer textured grain from plants such as durum wheat, sorghum, rice, barley and maize. They can also be used for producing transgenic plants with harder textured grain from plants such
                                                                                                                                                                                                                                                                                                                                                    Disclosure; Page 63; 75pp; English.
